Key words. stars: individual: Proxima Cen – planets and satellites: individual: Proxima B – planets and satellites: atmospheres – planets and satellites: detection – planets and satellites: terrestrial planets – errata, addenda

It has been brought to our attention that there is a minor typo in the $x$-axis title of the second panel of Fig. 5, which should have units of “kg kg$^{-1}$” rather than “g kg$^{-1}$”. The corrected figure appears below.

Fig. 5. Ten orbit mean profiles of temperature and water vapour (left and right panels, respectively) from the sub-stellar point on the dayside of the tidally locked planet (solid) and its antipode (dashed). Filled triangles show the surface temperature, and crosses indicate the position of the model levels.
